FOREWORD

It is with pleasure that the South Carolina Agricultural Statistics Service presents this 1986 edition of South Carolina Crop Statistics. The agricultural statistics in this publication include revised crop acres, yield, production and value statistics at the state and county level for 1984, and preliminary estimates for 1985. Also included are data on number of farms, land in farms, commercial fertilizer, fruit and vegetable statistics, and quarterly on and off grain stocks estimates.

This bulletin, is a cooperative effort between the National Agricultural Statistics Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship increases efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this Bulletin.

We are indebted to thousands of South Carolina farmers who voluntarily give their time and effort to report various information relating to their farming operation. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assisted in this effort. In addition to the voluntary reporters, I want to publicly thank my staff for their dedication in preparing this bulletin.

Sincerely,

Henry J. Power, Jr.

Henry J. Power, Jr.
Agricultural Statistician
in Charge

The South Carolina Agricultural Experiment Station is a cooperative program financed from federal and state funds. It is the policy of the Experiment Station to comply with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S.C. Agricultural Experiment Station, Clemson University, Clemson, S.C. 29631.

SOUTH CAROLINA CROP SUMMARY

1985

JANUARY: The record breaking warm spell that persisted since mid-December ended during the first week of January as a cold front moved across South Carolina. Average temperatures fell from 16 to 20 degrees above normal to 4 to 7 degrees below normal. Extremely low readings were recorded and many new all time low records were set mid-to late-January. Rainfall was light throughout the month.

The extreme cold temperatures in January caused severe bud damage to the peach crop in the Upstate. This was the beginning of almost a complete "freeze out" of the peach crop in the Piedmont. Lesser damage occurred in the Ridge and Coastal Plains areas. Winter vegetable crops were severely damaged by a hard freeze near the end of the month. Outside farm activities were slowed due to the cold conditions. Routine chores, pruning fruit trees, supplemental livestock feeding and repairing farm machinery were main activities.

FEBRUARY: February temperatures averaged 8-10 degrees colder than usual early in the month but climbed to near record highs by the end of the month. General rains were common during February with up to 2 inches falling during some storms.

The rainfall provided considerable relief to the Coastal Plains where soil moisture deficiencies were contributing to forest fires. Tobacco plant beds were virtually all seeded and in good condition. Growers were top dressing small grains, pruning fruit trees, repairing farm machinery and planning farm activities for the coming months.

MARCH: The warm spell that occurred late in February continued into March. Temperatures averaged from 5 degrees above normal Upstate to 8 degrees warmer than usual along the Coast. Cold air came over the state mid-month, with frost and freezing temperatures reported. Above normal temperatures returned by month's end. Showers were light during March, following the same pattern that had occurred for several months with heavier rains Upstate than elsewhere.

Soil moisture became short across the state. Numerous forest fires were reported mid-month. Peach condition was rated as poor to fair. Tobacco beds were generally in good condition. Small grains and pasture conditions were fair to good with some minor nutrient deficiencies reported. Growers continued with nitrogen applications where needed.

The major farm activities for March were land preparation for spring planting, supplemental livestock feeding, machinery repair and general farm chores.

APRIL: Temperatures started out 2 to 3 degrees above normal but fell during the second week of the month. Morning temperatures averaged in the 30's in the Central and Eastern parts of the state and in the 20's in Northwestern and Northcentral South Carolina with frost reported. Rainfall was deficient statewide with soil moisture rated as short to very short. Additional rainfall was needed for continued planting and germination.

The lack of soil moisture throughout April caused delays in planting corn, cotton, vegetables and peanuts. The dry conditions also affected germination and weed control. Damaging winds and blowing sands caused further problems. Growers irrigated to help the moisture stressed crops. The already damaged Upstate peach crop was hit again by freezing temperatures and frost. This virtually wiped out the peach crop in the Piedmont. The apple crop was also severely damaged, reducing the state's apple crop to about one-fourth of last year.

MAY: The month began with general rains across the state with the heaviest precipitation Upstate. A period of cloudy, humid weather with localized showers followed. Although these showers brought relief, soil moisture was still rated as short. Localities in the state ranged from 5 to 10 inches below their normal expected precipitation. The rest of the month brought scattered showers and thundershowers often accompanied by localized hail and high winds.

The corn crop was planted by early May and was in good condition considering the dry conditions. Many growers were plowing tobacco fields and putting down fertilizer with some fields being replanted due to the dry conditions. Soybean planting continued in some areas but was halted by dry soils in other areas. The peach crop was reported in poor to fair condition with production prospects, because of the Piedmont loss, expected to be about half of last year's crop. The strawberry harvest was in full swing. Watermelon growers used aerial spraying to control diseases. Reports on small grains indicated that stalks would be short and test weights light due to the spring drought. Pasture conditions varied as some areas reported improvement due to rainfall while other areas reported desperate conditions due to no rainfall.

JUNE: Good soaking rains throughout June resulted in improved crop situation in localized areas but overall conditions were rated poor to fair with varying degrees of crop stress reported. Lack of moisture in subsoils combined with high temperatures contributed to crop damage. Temperatures averaged 8 to 12 degrees above normal early in the month but returned to normal ranges for the rest of June.

Soybean planting slowed or stopped in several counties due to dry soil conditions but farmers were able to make considerable progress in areas that received showers. Tobacco producers in five counties reported hail damage with 600 acres severely damaged in Horry County. The cotton crop made good progress during June. Condition was good and the crop was maturing ahead of schedule. The small grain harvest was completed with most areas reporting disappointing yields. Good yields and quality were evident for the watermelon and blueberry crops. Vegetable crops were harvested rapidly with old crop residues being destroyed as fields were prepared for the next crop.

JULY: Showers across the state brought much needed relief to the crops in most counties. The rains brought many areas out of the precipitation deficit that has been prevalent this year while a few areas continued to need rain for crop improvement. At month's end, Hurricane Bob brought lingering showers that improved crop prospects and yield outlook. Storm damage was minor, but disease and weed control became a problem.

Cotton continued to look good with the percent of bolls set well ahead of the previous year's crop. Growers applied pesticides and herbicides as insect and weed problems increased late in the month. Tobacco topping was completed and harvest got underway in the largest producing counties. Soybeans continued to be in good shape throughout most of the state with herbicides applied as needed. Bloom and pod set ran ahead of the previous year. Corn silage harvest began with a good quality crop being put up. Peanut yield prospects continued to be good with overall condition rated as good. Sorghum harvest began late in July with insects a problem in some fields.

Peach harvest continued about a week ahead of normal with 85 percent of the crop harvested statewide. Watermelon harvest was completed in many areas with market demand and movement very light towards month's end.

AUGUST: The weather for the month was warm and humid with plenty of precipitation. Rainy weather conditions occurred over most of the state with thundershowers slowing field activities in many areas. Harvesting and cultivating of most crops were halted by excessive amount of rain added to already wet soils. Late season insect and weed problems were evident in areas of excessive soil moisture.

In general, farmers applied insecticide treatments in many fields in an effort to control insect problems such as the cyst nematode and corn earworm. Bollworms and armyworms were also active.

Some early planted cotton was opening rapidly while a sizeable acreage remained with blooms on the top. A few fields showed signs of water stress due to locally excessive rainfall. Excessive soil moisture created much concern over the quality of tobacco and slowed harvesting in most counties. The condition of the tobacco was good as marketing got into full swing. Corn and sorghum harvests progressed as field conditions allowed. Hay harvesting continued with several counties reporting a need for dry weather to get the crop in. A number of producers had a reduced quality crop due to rainfall on downed hay. Pasture and livestock conditions were good overall. Growers were busy during August as apple, grape, watermelon and cantaloup harvests were all active.

SEPTEMBER: The month began with rainy weather and excessive soil moisture in most parts of the state. Then the weather turned hot and dry throughout the month but with seasonably cool nights. This was good for corn and cotton harvesting as field work continued at a fast pace and most hay crops were brought in without rain. However, the weather did hinder fall planting activities as soil conditions became too dry for seedbeds. Declining soil moisture also adversely affected soybean development as most of the crop was in the critical pod filling stage of maturity. Hurricane Gloria moved past but well off our coastline. The Palmetto State was spared any significant damage from the storm but also failed to receive any of the much needed precipitation that accompanied the hurricane. As September ended, soil moisture ratings were 48% very short, 50% short and 2% adequate.

Reports from virtually all areas of the state indicated the soybean crop had been hurt by the lack of rainfall during September. Yields were down from earlier expectations and beans needed rainfall to fulfill their potential. Insect pressure was light in most areas, with a few scattered reports of velvetbean caterpillar and stinkbug infestation. Conditions have been excellent for cotton with the dry weather helping in defoliation. Cotton boll rot and insect pressure were evident in some fields but were not considered to be excessive. By month's end, harvesting was in full swing with yield and quality considered good to excellent. The condition of tobacco was good and harvest continued at a fast pace. Producers in some areas were letting the crop stay in the field longer to ripen in hopes of getting better prices. The peanut harvest showed very good yields and the dry weather helped digging conditions. Corn condition was fair to good as harvest continued active. Morning glories slowed harvesting in some fields.

Rainfall was needed to help size the apple crop. Harvest was active with condition of the crop rated at fair to good. Fall vegetable crops showed signs of stress from the shortage of moisture and the condition of most crops ranged from fair to good. There was an immediate need for rain to revive pastures. Conditions hindered land preparation and planting of small grains and winter grazing crops.

OCTOBER: Weather conditions varied across the state this month with a few areas getting sufficient rainfall while most areas were still needing more rain. General, widespread rainfall occurred during the first and last weeks of the month. Although rain was desperately needed to bring the soil moisture up to par, nearly all farm activities were slowed due to wet fields. Only scattered, intermittent showers were reported mid-month. A number of areas indicated that additional soil moisture was needed to aid winter grazing emergence and fall vegetable crops. Soil moisture ratings at month's end were 16% very short, 32% short and 52% adequate.

Soybeans were shedding leaves and maturing at a fast rate, especially in areas where little rainfall was received. Soybean harvesting was beginning to pick up by mid-month but had not begun in all areas. Early varieties generally had fair to good yields. Cotton harvesting continued at a rapid pace and was well ahead of last year's progress. Excellent yields and good quality were reported. Localized rainfall made fields too wet for harvesting equipment in a few areas. Corn harvest in most areas was completed with condition remaining fair to good. Peanut condition was good as harvest continued, showing good to very good yields. Harvest of sorghum and sweetpotatoes was active with each crop rated in fair to good condition.

Apple harvest was completed and quality was fair to good. The pecan crop was rated in fair condition as reports indicated that insect infestation was increasing, mostly due to summerlike weather conditions. Vegetable growers were active with the harvest of cucumbers, squash and turnips. Powdery mildew was a problem in some fields. Small grains and winter grazing were aided by the showers received but general rains were needed for continued growth. The planting of most small grain crops continued behind last year's pace.

NOVEMBER: Warmer than normal and wetter than usual described most of the month's weather. Although temperatures ranged from 10-15 degrees above normal for most of the month, with highs in the 70's and 80's, the first frost of the season occurred at many locations on the 9th. General rains and scattered showers were reported over the state during each week of the month. Rainfall varied from less than an inch to more than 6 inches. By the end of the month, soil moisture was rated as 48% adequate and 52% surplus.

Harvesting of all crops was slowed during the month due to the wet weather condition, but the soybeans were affected most of all. Very few soybeans were harvested during the month and reports indicated some soybeans were sprouting in the pods and rotting in the fields. By month's end, soybean harvest was well behind last year and the 5 year average. Harvest of the other field crops was also hampered but not to the extent in delay or crop deterioration that soybeans experienced.

Small grain plantings moved at a slow pace early in the month and slowed even more by month's end due to excessive soil moisture. The moisture and warm temperatures did benefit planted small grains with good germination and growth. Fall vegetables and pecan harvest moved along during the month, but were also slowed due to the weather. By the end of the month, pasture condition was rated at fair to good with winter grazing and livestock conditions good.

DECEMBER: Temperatures averaged below normal except during the second week of the month. Light showers fell across most of the state except for one period of excessive rainfall south of the Midlands early in the month.

Outside activities were light with many being slowed by wet conditions which remained from November. Small grain plantings remained well behind schedule although additional acreage could be planted as fields dried out. The soybean harvest was also slowed by existing conditions and it was anticipated that some acreage may not be harvested due to poor field conditions. The condition of soybeans that remained to be harvested was poor with additional deterioration expected. The cotton harvest was completed by Christmas.

SOUTH CAROLINA: Acreage, Yield, Production and Value of Crops, 1984 and 1985

1985 VEGETABLE ACREAGE HARVESTED UP 5 PERCENT

South Carolina's **acreage harvested** of all vegetable and small fruit commodities produced in 1985 was 46,188 acres, up 5 percent from the 44,116 acres harvested in 1984. The 1985 watermelon acreage showed a decrease of 11 percent while cucumbers for pickles increased by 45 percent when compared to 1984. Fresh market snap beans showed an increase of 5 percent from 1984 with tomatoes dropping 10 percent and fresh market cucumbers decreasing by 9 percent. Acreages harvested for other commodities were mixed from 1984, showing decreases ranging from 46 percent to 10 percent and increases ranging from 7 percent to 17 percent. The 1985 acreage harvested for sweetpotatoes was unchanged from 1984.

South Carolina's **value of production** of all vegetable and small fruit commodities decreased 13 percent in 1985 from 1984's $63.2 million to $54.8 million in 1985. The value of the five leading commodities decreased from 1984 with the exception of cucumbers for pickles which increased 75 percent and sweetpotatoes with a 6 percent increase. The value of production for watermelons, tomatoes, and fresh market cucumbers decreased 48 percent, 20 percent, and 55 percent respectively.

More detailed information on the 1985 vegetable survey is published in the "South Carolina Vegetable Statistics--AE439, April 1986."

1/Yield, production and average price in dozen bunches. 2/Includes: banana peppers, broccoli, cherry tomatoes, eggplant, Irish potatoes, kale, mustard greens, pumpkins, spinach, turnips, zucchini, and other processing vegetables.

South Carolina Farm Numbers Continue Downward

The number of farms in SOUTH CAROLINA in 1984 is estimated at 28,000 down 1,000 from 1983. For 1985, farm numbers are expected to drop another 500 to 27,500. Total land in farms was 5.6 million acres in 1984, down 3 percent from 1983. The preliminary estimate for 1985 land in farms is 5.5 million acres, down 2 percent from a year earlier. Average size of farm in 1984 and 1985 is 200 acres.

The number of farms in the UNITED STATES in 1985 is estimated at 2.28 million, down 2 percent from the 2.33 million in 1984 and 4 percent below 1983. Total land in farms for 1985 is 1,016 million acres, down fractionally from 1984 and 1 percent below 1983. Average size of farm in 1985 is 445 acres, 7 acres larger than 1984 and 13 acres larger than 1983.
